

dZshield SOC - Detailed Incident Report

1. Executive Summary & Automated Analysis

This report was automatically synthesized by the dZshield Agent layer. It correlates network logs across Layer 4 and Layer 5 detection engines to identify persistent threat vectors, unauthorized access attempts, and critical anomalies over the selected timeframe. The metrics below display the overall health and exposure of the environment during this period.

- > **Total Processed Environment Events: 57**
- > **Permitted (Allowed) Flow: 56**
- > **Blocked (Denied) Zero-Trust Drops: 1**
- > **Critical Security Alerts (Malicious Activity): 1**

2. Attack Vector Classification & Diagnostics

[High-Volume Traffic] The Source IP 10.100.50.50 generated 46 localized requests. This classifies as a potential Denial of Service (DoS) or Aggressive Brute-Force attack attempting to exhaust infrastructure resources.

[Reconnaissance] Activity seen across 8 different ports. This wide-net traversal indicates active Vulnerability Scanning and Penetration Reconnaissance across the perimeter.

[Web App Exploit] Critical signatures detected targeting web ports (80/443). This status indicates active exploitation payloads like SQL Injection, XSS, or Directory Traversal hitting the Layer 7 WAF.

[Unauthorized Access] Attackers targeted secured management/system ports (445, 3389). Status marked as 'Denied' implies Zero-Trust network firewalls successfully dropped untrusted network planes.

3. Malicious Actor Telemetry (Top Source IPs)

The following Source IPs generated the most anomalous or dropped traffic. High reoccurrences from a single address typically indicate automated vulnerability scanners, brute-force attempts, or botnet behaviors.

- [!] Source IP: 10.100.50.50 -> Total Recorded Occurrences: 46
- [!] Source IP: 94.26.68.55 -> Total Recorded Occurrences: 7
- [!] Source IP: 64.62.197.234 -> Total Recorded Occurrences: 1
- [!] Source IP: 20.169.105.81 -> Total Recorded Occurrences: 1
- [!] Source IP: 157.148.98.29 -> Total Recorded Occurrences: 1
- [!] Source IP: 195.223.233.202 -> Total Recorded Occurrences: 1

4. Targeted Infrastructure & Exploit Vectors

The attackers or unauthorized users primarily targeted the following internal infrastructure assets. Review these hosts to ensure no ports are unintentionally exposed.

Targeted Destination IPs: 23.54.83.210, 216.239.32.223, 13.69.239.77, 10.100.50.50, 142.250.67.74, 10.100.50.1, 142.250.67.65, 216.239.36.174, 142.250.193.42,

4.213.133.127, 20.49.150.241, 169.254.169.254, 52.168.112.67, 199.232.210.172,
216.58.196.106, 172.217.26.10, 216.239.34.223

Targeted Destination Ports: 445, 53, 137, 443, 49665, 80, -, 3389

5. AI Agent Strategic Remediation Playbook

Step 1: Network Containment - Immediately sinkhole or blacklist the top offending Source IPs at your perimeter firewall and WAF.

Step 2: Service Verification - You are seeing unusual traffic hitting specific Destination Ports. Ensure that highly targeted ports (like 22, 3389, 445) are not exposed to the public internet. If they must be, restrict access through a Zero-Trust Network Access (ZTNA) proxy.

Step 3: Alert Validation - The logs categorized as 'Malicious / Critical' represent traffic that successfully matched a threat signature. Review your application logs (e.g. NGINX, Apache) on these destination IPs to ensure the exploit payload was not successfully executed.

Step 4: Threat Intelligence - Feed the offending IPs into an automated Threat Intelligence Platform (e.g., n8n orchestrator querying VirusTotal / AbuseIPDB) to determine if your network is being targeted by an Advanced Persistent Threat (APT).
