

dZshield SOC - Detailed Incident Report

1. Executive Summary & Automated Analysis

This report was automatically synthesized by the dZshield Agent layer. It correlates network logs across Layer 4 and Layer 5 detection engines to identify persistent threat vectors, unauthorized access attempts, and critical anomalies over the selected timeframe. The metrics below display the overall health and exposure of the environment during this period.

- > **Total Processed Environment Events: 26**
- > **Permitted (Allowed) Flow: 26**
- > **Blocked (Denied) Zero-Trust Drops: 0**
- > **Critical Security Alerts (Malicious Activity): 0**

2. Attack Vector Classification & Diagnostics

Status generated by baseline network deviations. No specific advanced exploit chain identified; traffic likely consists of generic internet background noise or permitted standard access.

3. Malicious Actor Telemetry (Top Source IPs)

The following Source IPs generated the most anomalous or dropped traffic. High reoccurrences from a single address typically indicate automated vulnerability scanners, brute-force attempts, or botnet behaviors.

[!] Source IP: 10.100.50.50 -> Total Recorded Occurrences: 19

[!] Source IP: 94.26.68.55 -> Total Recorded Occurrences: 7

4. Targeted Infrastructure & Exploit Vectors

The attackers or unauthorized users primarily targeted the following internal infrastructure assets. Review these hosts to ensure no ports are unintentionally exposed.

Targeted Destination IPs: 10.100.50.1, 169.254.169.254, 172.217.24.74, 172.217.167.234, 10.100.50.50, 216.239.38.174

Targeted Destination Ports: 3389, 53, 80, 443

5. AI Agent Strategic Remediation Playbook

Action 1: Routine Posture: The current traffic baseline represents expected operations. Validate your monthly patching cycles and conduct random configuration audits on internet-facing resources.
